# Background: TB and M/DR-TB in SA

- South Africa faces a quadruple burden of disease: HIV/AIDS and sexually transmitted diseases, TB, maternal and child mortality, as well as non-communicable diseases
- SA rated 6<sup>th</sup> amongst 22 high burdened TB countries globally
- In 2016 - SA reported 237,266 DS-TB cases with a treatment success rate of 81.6% amongst All TB cases
- For same period: 10,722 DR-TB cases were notified with a MDR-TB success rate of 53% and XDR-TB success rate of 48%

# Overview digital health solutions for TB in South Africa

- The National TB Programme maintained a simple yet robust TB recording and reporting system since late 1990s
  - Consisted of standardized data collection tools, paper registers & electronic information systems - ETR.Net (DS-TB) and EDRWeb (DR-TB)
- In 2011, National HIV Programme implemented ART digitisation in facilities and retired paper ART registers
- Given high rates of HIV and TB co-morbidity in SA - vertical HIV and TB information systems seen as antithetical to increased integration of clinical services and as compromising patient management and clinical outcomes
- In 2015, the National Department of Health (NDOH) took the decision to integrate facility-based TB and HIV information systems (THIS) into a single, non-networked electronic system, that is TIER.Net.
- TIER.Net has been the lynchpin of the HIV M&E system in South Africa since 2011
  - Grounded in the digitisation of HIV data (HIV testing, pre-ART data and ART data) and lately presumptive TB and DS-TB outcomes from the patient clinical record in health facilities

# Overview digital health solutions for TB in South Africa (2)

- TIER.Net is the lynchpin of the HIV M&E system in South Africa (cont...)
  - Supports the day-to-day management of patients through the expression of “line lists” designed to address leakage across the ART and TB treatment cascades
  - Enabled reliable reporting of ART cohort data
  - Interoperable with the routine health information system (webDHIS)
  - TIER.Net is being implemented in nearly 4,000 health facilities
- THIS process commenced in earnest in April 2017
- In the process of replacing ETR.Net with TIER.Net (TB functionality) – i.e. point is to institute a single HIV/TB/PMTCT information system

The process has not been seamless.

# Challenges

- Non-networked solution has enabled the national footprint – however there are inherent constraints to a non-networked solution
  - Updating versions of software manual process
  - Flow of electronic dispatches up the administrative chain
- Paucity of unique identifier data in HIV and TB data
  - Highly mobile patient population which results in duplication of patient level data
- Integration process makes prescriptions re: patient admin processes in-facilities (which extends to integration of historically separate clinical records) – very challenging to get right
- Weak data demand and data use at facility and district level
- Inconsistent stewardship and technical guidance from sub-national governance structures

# Evidence of impact

- Improved patient administration processes at facility level
- Improved coordination amongst HIV, TB and PHC managers at (sub)district levels
- Integrated information system process in its infancy – can only make provisional inferences about impact on clinical outcomes
- Pilots/learning implementations conducted across several PHC facilities in 3 provinces
  - Integrated TB/HIV Information Systems being implemented in these facilities for over 2 years
  - Temporal trends suggest improvements in TB treatment initiation and success rates post implementation of the integrated TB/HIV Information Systems process

# Opportunities to advance digital solution for TB at scale

- Integrated TB/HIV Information Systems initiative has already been taken to scale in SA
- Nearly half of South Africa's 9 provinces are almost fully digitising TB and HIV data in TIER.Net
  - Implementation process of around 15-18 months
- In the process of mapping out integration of TIER.Net with national Health Patient Registration System (which houses demographic and unique identification data for significant number of patients)
- Centralisation of HIV and TB patient level data (that is, the “TIER data”) is currently underway

# Samples of line lists

## TB case identification results outstanding list

TB case identification tests requested but not yet back from the laboratory after 7 days (42 days for culture)

Folder Number	Name	Surname	Date Of Birth	Test Type	Test Date	Lab Reference
20326112	Khaya	Dubula	17/06/1978	Smear	31/05/2016
